

Metallisation Application Data Sheets

AC 11 Anti-Corrosive

The problem of corrosion on road vehicles is receiving ever-increasing attention and various systems are being devised to protect private cars. For commercial vehicles however, such as the semi-trailer illustrated above, without doubt, the best means of protection for the long life expected from these units is zinc spraying which will fully protect against rust and corrosion for a minimum of ten years without maintenance.

The specification for the treatment carried out on the chassis shown in the photograph was gritblasted followed by 100 microns (0.004") zinc sprayed with a Metallisation gas pistol. The manufacturer's usual decorative paint finish was then applied. Chassis treated in this way have been running for a number of years and the treatment has proved entirely satisfactory.
