AC 22 Anti-Corrosive

The roof structure of an up-to-date dispatch department situated at the premises of 'Frederick Robinson Breweries Ltd' has been treated for anti-corrosive protection using one of the Metallisation systems.

The structure, manufactured from mild steel, consists of 400 frames each 0.914M² (3ft) square, assembled by means of joining brackets.

The protective system employed was as follows: grit blasted to SA3 standard, flame metal sprayed with zinc to 75 microns (0.003") nominal thickness followed by an olive green inhibitive sealer Zn3/a. The sealer provided an adequate decorative finish without the need for further coats of paint.
