

Metallisation Application Data Sheets

AC1 Anti-Corrosive

Helicopter landing Platform

The structural steelwork of a helicopter landing platform is protected against the severe corrosion attack of its marine environment by the Metallisation Arcspray process.

The application calls for gritblasting and aluminium spraying to a depth of 150 μ m (0.006") in accordance with BS EN.22063. The sprayed surface is then treated with an Olive Green single pack inhibitive Sealer, followed by a coal tar epoxy paint system.
